# Starting Point and Goals

- ▶ You already know some  $\text{\LaTeX}$  and have been introduced to **Overleaf**
- ▶ Now, we'll learn about positioning **figures** and creating **tables** in  $\text{\LaTeX}$
- ▶ You'll have a chance to try this in your own document within Overleaf

[Click here to open the example document in Overleaf](#)

For best results, please use [Google Chrome](#) or a recent [Firefox](#).

- ▶ Let's get started!

# Graphics

- ▶ To handle external images,  $\text{\LaTeX}$  requires the `graphicx` package, which provides the `\includegraphics` command.
- ▶ Just add a `\usepackage{graphicx}` in the preamble.
- ▶ Supported graphics formats include JPEG, PNG and PDF.
- ▶  $\text{\LaTeX}$  treats graphics like a chunk of text (a box of a certain width and height).

[Click to download example image](#)

- ▶ Upload this image to Overleaf (use the project menu).

## Simple Example

```
\begin{figure}  
\centering  
\includegraphics[width=1.5in]{lithium.png}  
\end{figure}
```

[Click to download example image](#)

## Interlude: Optional Arguments

- ▶ We use square brackets `[ ]` for optional arguments, instead of braces `{ }`.
- ▶ `\includegraphics` accepts optional arguments that allow you to transform the image when it is included. For example, `[width=0.3\textwidth]` makes the image take up 30% of the width of the surrounding text. You can also use "real" units: `[width=1.5in]`.
- ▶ Other arguments include `[height]` and `[angle]`.
- ▶ Where do you find out about these? See the Online Resources at the end of this presentation for links to more information.

## Simple Example with Caption

```
\begin{figure}  
\centering  
\includegraphics[scale=0.5]{lithium.png}  
\caption{This is Lithium ( ${}^6\text{Li}$ )}  
\end{figure}
```

Figure: This is Lithium ( ${}^6\text{Li}$ )

# Labeling Figures

- ▶ By default,  $\text{\LaTeX}$  will decide where the figure will go within the document (figures and tables “float”). A Float is an object (typically a table or figure) which cannot be broken over a page.
- ▶ You can caption a float.
- ▶ With a caption, you can also reference a float using a `\ref` and `\label` pair:

```
\documentclass{article}
\usepackage{graphicx}
\begin{document}

Figure \ref{fig:gerbil} shows \ldots

\begin{figure}
\centering
\includegraphics[
  width=0.5\textwidth]{gerbil}
\caption{\label{fig:gerbil}Aww\ldots.}
\end{figure}

\end{document}
```

Figure 1: Aww....

Figure 1 shows ...

# Placing Figures

$\text{\LaTeX}$  tries to put a float in the "best" place, to make the document look nice. Overall, it is very good at this.

Because floats are treated as separate entities, and placed on a separate part of the page, away from other text, they tend not to "fit" in the exact place you have placed them in your electronic text.  $\text{\LaTeX}$  is good at finding the optimal location for a float, and placing it there, so you don't have to continue to edit the document, moving figures around whenever you add or remove a bit of text. So we let  $\text{\LaTeX}$  do all the hard work.

- However, sometimes you need to tweak the position of a float. One way is to use the optional position argument in `\begin{figure}[position]`.  
For example: `\begin{figure}[b]`

Option	Position
<b>h</b>	Place the float <b>h</b> ere (more or less)
<b>t</b>	Position at the <b>t</b> op of the page
<b>b</b>	Position at the <b>b</b> ottom of the page
<b>p</b>	Place it on a special <b>p</b> age for floats only
<b>!</b>	Prevent L <sup>A</sup> T <sub>E</sub> X from trying to adjust float location
<b>H</b>	Place the float precisely <b>H</b> ere (like <b>h</b> !)

# Intro to Tables

- ▶ Tables in  $\text{\LaTeX}$  take some getting used to.
- ▶ In general, you should only try to create *from scratch* within  $\text{\LaTeX}$  very simple tables.
- ▶ For real life tables, it will be far easier to export *the data* directly from your code, with  $\text{\LaTeX}$  formatting added by your code.
- ▶ Tools exist to help you with this:
  - ▶ [Excel2 \$\text{\LaTeX}\$](#)
  - ▶ [Py \$\text{\LaTeX}\$](#)  (or DataFrame in Pandas).
  - ▶ `print(xtable(MyRdata, type = "latex"), file = "MyRtab.tex")`
  - ▶ [Other options](#)
- ▶ Once you have exported the properly formatted data, you can copy and paste it into your document (or just upload it into your project as a separate file).

# A Simple Table

- ▶ Use the tabular environment from the tabularx package.
- ▶ The argument specifies column alignment — left, right, right.

```
\begin{tabular}{lrrr}  
Item & Qty & Unit & \$ \\Widget & 1 & & 199.99 \\Gadget & 2 & & 399.99 \\Cable & 3 & & 19.99 \\ \end{tabular}
```

Produces the following table:

Item	Qty	Unit	\$
Widget	1		199.99
Gadget	2		399.99
Cable	3		19.99

- ▶ Use an ampersand `&` to separate columns and a double backslash `\\` to start a new row.

## Tables: Adding Lines

- ▶ You can also specify vertical lines in the optional arguments (use `\hline` for horizontal lines).

```
\begin{tabular}{|l|r|r|} \hline
Item   & Qty & Unit \ $ \\ \hline
Widget & 1   & 199.99 \\
Gadget & 2   & 399.99 \\
Cable  & 3   & 19.99  \\ \hline
\end{tabular}
```

Produces:

Item	Qty	Unit \$
Widget	1	199.99
Gadget	2	399.99
Cable	3	19.99

- ▶ Note: The spacing and alignment in the typed table does not impact the spacing and alignment in the typeset table.

## Tables: Aligning Columns

- In addition to aligning the columns to left, right or center, you can use an @-expression

```
\begin{tabular}{r@{.}l}  
3  & 14159  \\  
16 & 2        \\  
123& 456     \\  
\end{tabular}
```

Produces:

```
3.14159  
16.2  
123.456
```

- What happened? All of the space between the two columns was removed, and a decimal point was inserted in between. A bit odd, but this is a way to make a column of numbers of different precision line up on the decimal point. You do have to separate the numbers (replacing the decimal point with an ampersand).

## Tables: `\multicolumn` and `\multirow`

```
\begin{tabular}{| l | l | r | } \hline
\multicolumn{2}{|c|}{Item} & \multirow{2}{*}{Price (\$)} \\ \hline
Animal & Description & \\ \hline
Gnat & per gram & 13.65 \\
      & each & 0.01 \\
Gnu & stuffed & 92.50 \\
Emu & stuffed & 33.33 \\
Armadillo & frozen & 8.99 \\ \hline
\end{tabular}
```

Produces:

Item		Price (\$)
Animal	Description	
Gnat	per gram	13.65
	each	0.01
Gnu	stuffed	92.50
Emu	stuffed	33.33
Armadillo	frozen	8.99

## Tables: Positioning, Caption and Labeling

Item		Price (\$)
Animal	Description	
Gnat	per gram	13.65
	each	0.01
Gnu	stuffed	92.50
Emu	stuffed	33.33
Armadillo	frozen	8.99

Table: Wholesale Prices
